Running

PARMEC is a command line program. Typical usage:

- 1. Place PARMEC in a globally accessible path (e.g. suitably extend the PATH variable on a unix system).
- 2. Create a directory where your input file and output files will be stored (e.g. mkdir test).
- 3. Edit your Python input file in this directory (e.g. test.py); Chapter 2 documents all input commands.
- 4. Run PARMEC (e.g. PARMEC path/to/test/test.py).
- 5. Time histories can be generated during analysis using the HISTORY command; see Section 2.15.
- 6. Upon termination a *.dump file and/or a *.vtk file(s) is/are created in the same directory (e.g. path/to/test/test.dump); their format is documented in Chapter 3.
- 7. The output files can be viewed with OVITO and/or ParaView, as documented in Chapter 4.

A tutorial is provided in Chapter 5.

Input commands

PARMEC input language extends Python. Subroutines related to input processing are listed below.

2.1 RESET

Erase all data.

RESET ()

2.2 MATERIAL

Create material.

matnum = MATERIAL (density, young, poisson)

- matnum material number
- $\bullet \ \mathbf{density}$ mass density
- young Young modulus
- $\bullet\,$ poisson Poisson ratio

2.3 SPHERE

Create a spherical particle.

parnum = SPHERE (center, radius, material, color)

- $\bullet\,$ $\,$ particle number
- \bullet ${\bf center}$ tuple (x,y,z) defining the center
- radius radius
- material material number
- $\bullet\,$ ${\bf color}$ positive integer surface color

2.4 MESH

Create a meshed particle.

parnum = MESH (nodes, elements, material, colors)

- parnum particle number
- **nodes** list of nodes: [x0, y0, z0, x1, y1, z1, ...]
- elements list of elements: [e1, n1, n2, ..., ne1, me1, e2, n1, n2, ..., ne2, me2, ...], where e1 is the number of nodes of the first element, n1, n2, ..., ne1 enumerate the element nodes, and me1 is the material number. Similarly for the second and all remaining elements. Supported numbers of nodes per element are 4, 5, 6, and 8 for respectively tetrahedron, pyramid, wedge, and hexahedron, cf. Figure 2.1.
- material material number
- colors list of positive integer face colors: [gcolor, f1, n1, n2, ..., nf1, c1, f2, n1, n2, ..., nf2, c2, ...], where gcolor is the global color for all not specified faces, f1 is the number of nodes in the first specified face, n1, n2, ..., nf1 enumerate the face nodes, and c1 is the surface color of that face. Similarly for the second and all remaining faces. If only the global color is required, it can be passed as [gcolor] or as gcolor alone.

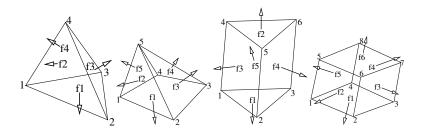

Figure 2.1: Element types.

2.5 ANALYTICAL

Create an analytical particle. Analytical particles have no shapes and are not involved in contact.

parnum = ANALYTICAL (| inertia, mass, rotation, position, material, particle)

Note, that all parameters are optional.

- parnum particle number
- inertia inertia tensor passed as a list [Ixx, Iyy, Izz, Ixy, Ixz, Iyz]; optional, if particle parameter is used; default [1, 1, 1, 0, 0, 0]
- mass scalar mass; optional, if particle parameter is used; default 1
- **rotation** optional orientation matrix passed as a list [e1x, e1y, e1z, e2x, e2y, e2z, e3x, e3y, e3z], where vectors e1, e2, e3 are orthonormal; default [1, 0, 0, 0, 1, 0, 0, 0, 1]
- position optional position vector passed as a tuple (x, y, z); default (θ, θ, θ)

- material material number; default θ
- particle optional; if specified, an existing particle is converted into an analytical particle; its properties are inherited or overwritten, depending on whether any of the inertia, mass, rotation, position parameters are used; if initially specified, particle shape is inherited and its animated motion is included into the results

2.6 OBSTACLE

Create an obstacle.

OBSTACLE (triangles, color | point, linear, angular)

- triangles list of triangle tuples [(t1x1, t1y1, t1z1, t1x2, t1y2, t1z2, t1x3, t1y3, t1z3), (t2x1, t2y1, t2z1, t2x2, t2y2, t2z2, t2x3, t2y3, t2z3), ...] defining the obstacle
- color positive integer surface color or a list [color1, color2, ...] of colors for each individual triangle
- point spatial reference point
- linear linear velocity history callback: $(v_x, v_y, v_z) =$ linear (t)
- angular spatial angular velocity history callback: $(\omega_x, \omega_y, \omega_z) =$ angular (t)

2.7 SPRING

Create a translational spring constraint. The applied force formula reads

$$\text{force}\left(t\right) = \text{direction}\left(t\right) \cdot \left[\text{spring}\left(\text{stroke}\left(t\right)\right) + \text{dashpot}\left(\text{velocity}\left(t\right)\right) \cdot \left|\text{sign}\left(\text{spring}\left(\text{stroke}\left(t\right)\right)\right)\right|\right]$$

where

direction
$$(t) = (\text{point2}(t) - \text{point1}(t)) / |\text{point2}(t) - \text{point1}(t)|$$
 or constant (d_x, d_y, d_z)

stroke
$$(t) = \operatorname{direction}(t) \cdot [\operatorname{point2}(t) - \operatorname{point1}(t)] - \operatorname{direction}(0) \cdot [\operatorname{point2}(0) - \operatorname{point1}(0)]$$

velocity $(t) = \operatorname{direction}(t) \cdot \frac{d}{dt} [\operatorname{point2}(t) - \operatorname{point1}(t)]$

$$\int_{0}^{\infty} -1 \text{ if } x < 0$$

$$sign(x) = \begin{cases} -1 & \text{if } x < 0 \\ 0 & \text{if } x = 0 \\ 1 & \text{if } x > 0 \end{cases}$$

The spring (stroke) and dashpot (velocity) relationships are defined by means of lookup tables; force (t) is applied at point (t), and -force (t) is applied at point (t); dashpot force is not applied when spring force is zero.

SPRING (part1, point1, part2, point2, spring | dashpot, direction)

- part1 first particle number
- **point1** tuple (x, y, z) defining a point moving with the first particle
- part2 second particle number; -1 can be used to indicate a single-particle constraint
- point 2 tuple (x, y, z) defining a second point, either moving with the second particle, or a spatial point
- $spring spring force lookup table [stroke_1, force_1, stroke_2, force_2, ..., stroke_n, force_n]$
- dashpot optional dashpot force lookup table [velocity₁, force₁, velocity₂, force₂, ..., velocity_m, force_m]; default: $[-\infty, 0, +\infty, 0]$
- direction optional constant direction (d_x, d_y, d_z)

2.8 GRANULAR

Define surface pairing for the granular contact interaction model.

GRANULAR (color1, color2, spring | damper, friction, rolling, drilling, kskn)

- color1 first color (positive, or color1 = 0 and color2 = 0 to redefine default parameters)
- color2 second color (positive, or color1 = 0 and color2 = 0 to redefine default parameters)
- spring normal spring constant
- damper optional normal damping ratio; default: 1.0
- friction optional Coulomb's friction coefficient; default: 0.0; tuple (μ_s, μ_d) can be used to specify respectively static and dynamic friction coefficients
- rolling optional rolling friction coefficient; default: 0.0
- drilling optional drilling friction coefficient; default: 0.0
- kskn optional ratio of normal to tangential spring and dashpot parameters; default: 0.5

2.9 CONSTRAIN

Constrain particle motion.

CONSTRAIN (parnum | linear, angular)

- parnum particle number
- linear list $[x_1, y_1, z_1]$, $[x_1, y_1, z_1, x_2, y_2, z_2]$, or $[x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3]$ defining directions of constrained linear motion; default: [0, 0, 0]
- angular list $[x_1, y_1, z_1]$, $[x_1, y_1, z_1, x_2, y_2, z_2]$, or $[x_1, y_1, z_1, x_2, y_2, z_2, x_3, y_3, z_3]$ defining directions of constrained spatial rotation; default: [0, 0, 0]

2.10 PRESCRIBE

Prescribe particle motion. Prescribed motion overwrites this resulting from dynamics and constraints.

PRESCRIBE (parnum | linear, angular, kind)

- parnum particle number
- linear linear velocity or acceleration history callback: $(v_x, v_y, v_z) =$ linear (t); default: not prescribed
- angular spatial angular velocity or acceleration history callback: $(\omega_x, \omega_y, \omega_z) =$ angular (t); default: not prescribed
- kind string 'vv', 'va', 'av', or 'aa' indicating interpretation of respectively linear and angular time histories as either velocity or acceleration; default: 'vv'

2.11 VELOCITY

Set particle velocity.

VELOCITY (parnum | linear, angular)

- parnum particle number
- linear linear velocity tuple (v_x, v_y, v_z) ; default: (0,0,0) at t=0
- angular angular velocity tuple $(\omega_x, \omega_y, \omega_z)$; default: (0,0,0) at t=0

2.12 GRAVITY

Set gravity.

GRAVITY (gx, gy, gz)

- \bullet gx constant x component
- $\bullet~{\bf gy}$ constant y component
- \bullet **gz** constant z component

2.13 CRITICAL

Estimate critical time step.

h = CRITICAL ()

• h - critical time step

2.14 DEM

Run DEM simulation.

t = DEM (duration, step | interval, prefix)

- t simulation runtime in seconds
- duration simulation duration
- step time step
- interval output interval (default: time step); tuple $(dt_{\text{files}}, dt_{\text{history}})$ can be used to indicate different output frequencies of output files and time histories
- prefix output file name prefix (default: input file name without the ".py" extension)

2.15 HISTORY

Request time history output.

list = HISTORY (entity | source, point)

- list output time history list
- entity entity name; one of: (output time) 'TIME', (position) 'PX', 'PY', 'PZ', '|P|', (displacement) 'DX', 'DY', 'DZ', '|D|', (linear velocity) 'VX', 'VY', 'VZ', '|V|', (angular velocity) 'OX', 'OY', 'OZ', '|O|', (body force) 'FX', 'FY', 'FZ', '|F|', (body torque) 'TX', 'TY', 'TZ', '|T|'
- source particle number i, or a list of particle numbers [i, j, ...], or a spatial sphere defined as tuple (x, y, z, r), or a spatial box defined as tuple $(x_{\min}, y_{\min}, z_{\min}, x_{\max}, y_{\max}, z_{\max})$; in case of a list of particle numbers the output entity is averaged over the set of particles; in case of a spatial sphere or box the output entity is averaged over the set of particles passing through it; default: 0 (useful when entity is 'TIME')
- point optional referential point used in case of a single particle source; default: particle mass centre

2.16 OUTPUT

Define scalar and/or vector entities included into the output file(s).

OUTPUT (entities | subset)

- entities list of output entities; default: ['NUMBER', 'COLOR', 'DISPL', 'LINVEL', 'ANGVEL', 'FORCE', 'TORQUE'] corresponding to particle numbers, surface colors, displacement, linear velocity, angular velocity, body force, and body torque, respectively
- subset optional particle number i, or a list of particle numbers [i, j, ...], to which this specification is narrowed down
